

Week 10 Homework

March 23, 2016

Create a R source file that does the following:

1. Imports a data set of your choosing on which you will be able to perform both an OLS and logistic regression
2. Cleans the data and sets up one continuous(ish) dependent variable, one binary variable, and at least three independent variables.
3. Runs an OLS regression and displays the results
4. Runs a logistic regression and displays the results

I won't post a key (since week10.R basically does the above). If you have trouble getting your script to run, send me an email, attaching your source file and dataset, and I can help troubleshoot.
